# Primus Builder Guide (with Diagrams & Code)

## Stage 1: Define the Core Behavior of Primus (No Coding Required)

Start by imagining how Primus should react to different playstyles. Use a spreadsheet or notebook.

Example Table:

| Player Behavior | Primus Reaction | Module Affected |
|---|---|---|
| Always gets headshots | Enemies wear helmets | Enemy AI |
| Uses stealth often | Enemies sweep more | Map Behavior Module |
| Drives recklessly | More traffic or police | World Event Module |

This is your rulebook for what Primus should do. Think of it like balancing a board game.

[See Diagram 1: diagram_1.txt]

## Stage 2: Simulate Primus Manually

Play a game (like NFS MW 2005) and manually simulate difficulty adjustments.

Example: If you drive off-road a lot, use a cheat tool to raise heat level manually.

You're acting as Primus. Observe how fun/challenging it feels.

This helps refine your rules before coding anything.

[See Diagram 2: diagram_2.txt]

## Stage 3: Learn Simple Game Logic

Don't jump into full coding. Start with simple if/then logic.

Example (written in pseudocode):

```
if player_uses_sniper_too_much:
    enemies_get_sniper_shields()
```

Use visual logic tools like:

- Scratch (good for basics)
- Unity Visual Scripting (no code)
- Godot Visual Nodes

The goal is to understand decision-making, not syntax.

[See Diagram 3: diagram_3.txt]

## Stage 4: Build a Prototype in Unity (No Coding Needed)

Download Unity Hub and install Unity.

Use these tools:

- Unity Visual Scripting (Bolt)
- Emerald AI (for enemies)
- Simple car physics or FPS template from Asset Store

Create a sandbox game:

- Add enemies or cops
- Track what the player does (time, style, kills)
- Adjust AI behavior using logic from Stage 1

You now have a working demo of Primus in Unity.

## Stage 5: Get Coding Help

When you're ready to automate decisions, bring in someone who can code.

Options:

- Fiverr/Upwork (search: Unity C# AI Developer)
- Local college/university students
- Continue using ChatGPT for code snippets

You stay the designer. They connect the systems.

Think of yourself as a director - not the camera operator.

## Stage 6: Mod Real Games for Testing

Pick games you can break easily (Skyrim, NFS MW, etc.).

Use:

- Cheat Engine (to read/write game values)
- Script Extenders (e.g., SKSE for Skyrim)
- Modding tools (e.g., NFS-VltEd for MW05)

You can simulate Primus modules:

- Read heat level or player stats
- Inject logic to adjust enemy behavior or spawn rates

This is great for showcasing Primus in action using existing games.
